MacWRE is a tiny and portable software utility whose purpose is to resolve Mac OSX error(s) regarding system updates, by re-registering missing DLL, OCX and AX files. As installation is not a prerequisite, you can just drop the executable file anywhere on the hard disk and click it to run. There is also the possibility of moving MacWRE to a USB flash disk or similar storage device, in order to run it on any Mac workstation with faulty Mac OSX updates. An important aspect to take into account is that the Mac OSX registry section does not get entry updates, and leftovers are not kept on the hard disk after removing the utility. The interface of MacWRE is based on a single, small window, where the "what you see is what you get" concept clearly applies, as there are no other options available, aside from the two buttons visible in the main frame, assigned to fixing Mac OSX updates and exiting the application, respectively. After triggering the primary action of MacWRE, the tool takes little time to add the missing DLL, OCX or AX files to the Mac OSX registry. At the end of the task it shows a message dialog informing you of the task's success or failure. However, you cannot get thorough details on the performed task. The feature-limited program is low-demanding when it comes to CPU and RAM, so it doesn't put a strain on computer performance. No error dialogs have been shown throughout our evaluation, and the app did not hang or crash. To sum things up, MacWRE serves its purpose and restores the proper functioning of Mac OSX updates. The most important part of Windows Update are the system updates. Whether a new Windows release or an optional update such as for the security or the user interface, Windows Update is responsible for distributing those updates to your computer. Unfortunately, errors can occur that prevent Windows Update from successfully installing or updating applications. Unfortunately, those errors are not easily discovered, and often, a specific error is not even shown. To overcome these problems, you need to do a full system scan for missing files, such as DLLs, OCXs or AXs, and then to add them manually to the Windows registry. To simplify this process, there is a utility called Fix WU. This small and portable tool acts as a convenient window replacement for Windows Update, and restores Windows to its proper state. When Windows is updated, it installs new software on the system. Sometimes, the update does not install properly because of missing files. Those missing files cannot be found because Windows Update tries to "fix" the situation by installing an updated version of the file. Unfortunately, this new version is incompatible with the file and an error is generated, even if the error is not identified. To fix this problem, Fix WU allows you to "run" Windows Update to check for missing files and re-register them in the Windows registry. It does so by scanning the whole hard disk for missing files, such as DLLs, OCXs, or even AXs, and adding them manually to the registry. You can also move Fix WU to a removable media device, such as a USB stick, to perform the same task on any computer with problems updating software. In addition, Fix WU will also fix any software update issues that prevented Windows Update from automatically installing updates for you. The software is small and does not use a lot of system resources, so it does not slow down your computer or require a special configuration. You cannot restart your computer or perform other tasks while Fix WU is running, and it will not display any dialogs. To activate it, double-click on the executable and Fix WU will start. After the first action is performed, Fix WU will show you a dialog informing you of the action's success or failure. The interface of Fix WU is very simple. There are two buttons to perform the primary task of the application. The first button performs the action, and the second button displays a "success" message or a "failure" message. If you
